

Ideal for use in care homes for the elderly, paediatric clinics, rehab clinics and for home use.

The Treadcare® GRTS360 specifically designed for use by patients in recovery or undergoing rehabilitation as part of ongoing therapy. Unlike any other heavy-duty rehabilitation treadmill, the GRTS360 has a start-up speed of just 0.1Km/h increased in very gradual speed increments of 0.1km/h. This design feature makes way for safe and controlled workouts during the early stages of a rehab program.

The full-length side hand rails are fully height adjustable (with fourteen height settings), specifically designed to accommodate users of varying height and provide extra user support and safety during use.

Sturdy upper steel frame designed for attaching a treadmill body harness (optional) in order to support body weight - ideal for weak patients just starting out a rehab program.

The GRTS360 ensures a safe space to walk on - with its large walking area measuring 430mm x 1260mm this machine can accommodate users weighing up to 130Kg.

To sum up: The GRTS360 is a unique rehabilitation treadmill easily accommodating all size users.
